

Managed Backup and Disaster Recovery (BaaS / DRaaS)

TorchLight leverages Rubrik to create a completely managed Backup and Disaster Recovery with Ransomware Defense.

Overview

Our BaaS solution is powered by Rubrik technology which eliminates the need for backup and search servers, disk backup and tape archive. It integrates data orchestration, deduplication and catalog management to enable you to expand securely using hybrid cloud backup with the ability to access data instantly from anywhere. With Rubrik cloud data backup solutions you can automate backup policies set by Service Level Agreements (SLAs) to suit your business needs.

Disaster Recovery as a Service (DRaaS) provides the ability to recover all your critical company IT systems offsite without the need for a secondary data center. In the event of a significant IT failure your servers, applications and data can be brought online rapidly allowing your business to continue operating with minimum disruption. Our solution is fully managed, flexible and scalable, allowing your business to have systems fully recovered by us at a geographically independent site, leaving IT resources free to handle operations locally.

The most inclusive package spans four key service components:

Recovery Time Objective: Typically, recovery of your entire environment can take between 1 and 2 hours for supported VM's.

Recovery Point Objective: Recovery can be performed to any point in time that is replicated to our data center. Typically, this is the latest version, however, we can bring back earlier versions just as quickly in the case of Ransomware for example.

Disaster Recovery Testing: We offer an initial DR Test free of charge to prove the recoverability of the environment followed up by an annual DR test which is inclusive with all our DRaaS contracts.

Architected for Performance: Using high end components we to deliver a recovery environment that delivers an end user experience comparable to that in the original workplace.
